

# Climate Change & Community Resilience

Climate change poses one of the greatest challenges to environmental and human well being in the Koh Rong archipelago. Drought, decline in biodiversity, and a surge in storm severity caused by this global phenomenon has made Cambodia one of the planet's most vulnerable countries. With support from the Asian Development Bank and Plan International, the Song Saa Foundation is implementing a climate action plan to manage the impacts of climate change on local communities.

## Project

By partnering with Plan International and ADB, the Foundation will construct rainwater harvesting facilities in local villages and distribute water filters. We will also work to promote mangrove protection and planting as well as raise public awareness through knowledge building activities.

## Impact

- Reliable access to safe, clean water
- Protect natural systems that mitigate the impacts of climate change
- Increase awareness of the impact climate change has on the archipelago
